2.1 Functional Requirements

The functional requirements listed below are drawn from the user stories established in Part 1. Every requirement specifies exactly what the system needs to do in order to satisfy the user's needs, following the standard "The system shall" format.

Gardeners / Field Employees

"As a gardener, I want to receive my daily schedule/job plan along with the customer's address on my phone."

FR1: The system shall present the logged-in gardener with a daily schedule of assigned jobs, ordered chronologically.

FR2: The system shall connect with a GPS mapping API so that, when the job location is clicked, turn-by-turn navigation to the customer's registered address is provided.

"As a gardener, I want to be aware of any special requests a customer has for the job."

FR3: The system shall display any active "Special Instructions" text fields linked to a booking prominently on the gardener's individual job detail screen.

"As a gardener, I want to mark the jobs I complete and attach photos of the work performed."

FR4: The system must let the user capture and upload as many as 5 image files (JPEG/PNG, each no larger than 5MB) straight to a job record.

FR5: Once the required photos and completion checklist have been submitted, the system must automatically set the job status to "Completed" and add a timestamp to the record.

"As a gardener, I would like to log my expenses, including fuel and vehicle maintenance."

FR6: The system must offer an "Expense Claim" form that lets the user enter the expense amount, choose a category (such as Fuel or Maintenance), and upload a photo of the physical receipt.

Office / Administrative Staff

"As an office assistant, I would like to build schedules digitally and assign them to staff members."

FR8: The system must offer a calendar interface so administrative staff can create, edit, and assign job tickets to particular gardener profiles.

"As an office assistant, I want to see which jobs have been completed so that I can issue invoices."

FR9: The system must automatically send an alert to the administrative dashboard whenever a job status changes to "Completed".

FR10: The system shall automatically create a draft PDF invoice from the completed job's predefined rate and duration, subject to admin approval.

"As an office assistant, I want a digital space in which to store customer information."

FR11: The system shall provide a Customer Relationship Management (CRM) module that keeps customer contact details, past job history, and recurring special requests.

"As an office assistant, I want to answer customer inquiries from within the application."

FR12: The system shall offer an internal ticketing and messaging module that lets staff receive and respond to customer messages inside the portal.

Managers

"As a manager, I want to find my staff members and track their work progress."

FR13: The system shall present a live, map-based tracking dashboard that displays the current GPS location and active job status of every clocked-in field employee.

"As a manager, I want to see the jobs completed, invoices sent, and expenses claimed."

FR14: The system shall produce automated weekly reporting dashboards that compile total completed jobs, pending/paid invoices, and total expense claims.

"As a manager, I want to approve expense claims from the application."

FR15: The system shall offer a managerial queue where submitted expense claims can be reviewed, checked against uploaded receipts, and marked as "Approved" or "Rejected".

Customers

"As a customer, I would like to be able to see how far away the gardening team is."

FR16: The system shall offer a real-time tracking interface for the customer, showing the estimated time of arrival (ETA) once the gardener's status is set to "En Route".

"As a customer, I want to be able to submit work requests as well as special requests."

2.2 Information Architecture (Sitemap)

The website's information architecture is built to serve both public visitors (prospective customers) and internal stakeholders (staff and existing customers).

Hierarchical Structure

- **Home Page (Landing Page)**
  - About Us
  - Services (Maintenance, Landscaping, Tree Felling)
  - Contact Us
  - Sign Up / Login (Gateway to portals)
- **1. Customer Portal** (Requires Login)
  - Dashboard
  - My Bookings (Past & Upcoming)
  - Track Team (Active Job)
  - Invoices & Payments
  - Messages / Special Requests
- **2. Staff Portal: Gardener** (Requires Login)
  - Daily Schedule / Route Map
  - Active Job Interface (Checklist & Photo Upload)
  - Expense Claims
- **3. Staff Portal: Admin & Manager** (Requires Login)
  - Scheduling Calendar
  - Live Staff Tracking Map
  - Customer Database (CRM)
  - Financials (Invoicing & Expense Approvals)
  - Reporting Analytics

2.3 Landing Page Design and HCI Principles

Mobile-First Responsive Design and HCI Research

When designing digital platforms used by diverse user groups—from gardeners on the move to administrators at their desks—a mobile-first responsive strategy is essential. Mobile-first design requires designers to identify the most vital features for the smallest screens first, then gradually improve the interface for larger desktop displays (Wroblewski, 2011).

a. Landing Page Design (Figma)

[Insert Exported Figma Landing Page Image Here]

b. Design Techniques and Justification

Based on the Figma design principles applied, the following HCI design techniques were used to guide the user:

1. **Anchoring and Familiarity:**
   - *Application:* The main "Sign Up / Login" button is placed in the top-right corner of the navigation bar, while the primary "Book a Service" Call to Action (CTA) sits centrally within the hero section.
   - *Justification:* Anchoring draws on the user's mental model and their past experiences with web interfaces. Since most commercial websites position user access points in the top right, placing it there shortens the time a customer needs to work out how to reach their portal (Norman, 2013).

2. **Visual Hierarchy and Typography:**
   - *Application:* The hero section makes use of a large, bold H1 font (for example, "Professional Gardening at Your Fingertips"), which is then followed by a smaller H2 sub-headline, along with standard body text for descriptions.
   - *Justification:* A visual hierarchy naturally steers the user's eye from the most critical piece of information (the value proposition) down to the supporting details. This keeps the user from feeling overwhelmed by a wall of uniform text.

3. **Color Contrast for Actionable Elements:**
   - *Application:* The website mostly relies on a natural, earthy color palette (greens and whites), yet the primary CTA buttons ("Book Now", "Sign Up") stand out through a high-contrast accent color, such as a vibrant orange or deep forest green.
   - *Justification:* In HCI, contrasting colors indicate interactivity. By setting the buttons visually apart from the background imagery and standard text, the user instantly grasped where they should click to begin a task.

2.4 Task Flow: Sign-up for an Account

The step-by-step task flow below defines how a new GreenLeaf Garden Services customer sets up an account, using the specific shape conventions requested.

Task Flow Steps:

CIRCLE The customer clicks the "Sign Up" button on the website homepage.

↳ RECTANGLE The system presents the "Create Account" registration screen (Fields: Name, Address, Email, Password).

↳ CIRCLE The customer fills in their personal details and clicks the "Submit Registration" action.

↳ DIAMOND The system validates the submitted information (e.g., checking whether the email is already registered and whether the password meets criteria).

→ **(Invalid Branch)** OCTAGON The system shows an error message ("Email already exists" or "Password too weak"). *(Arrow looping back to Step 2)*.

→ **(Valid Branch)** RECTANGLE The system presents the "Account Verified" confirmation screen.

↳ OCTAGON The system sends a welcome email and shows a success message: "Your account has been created. Please log in."
